

Digital Repositories and the Semantic Web: Semantic Search and Navigation for DSpace

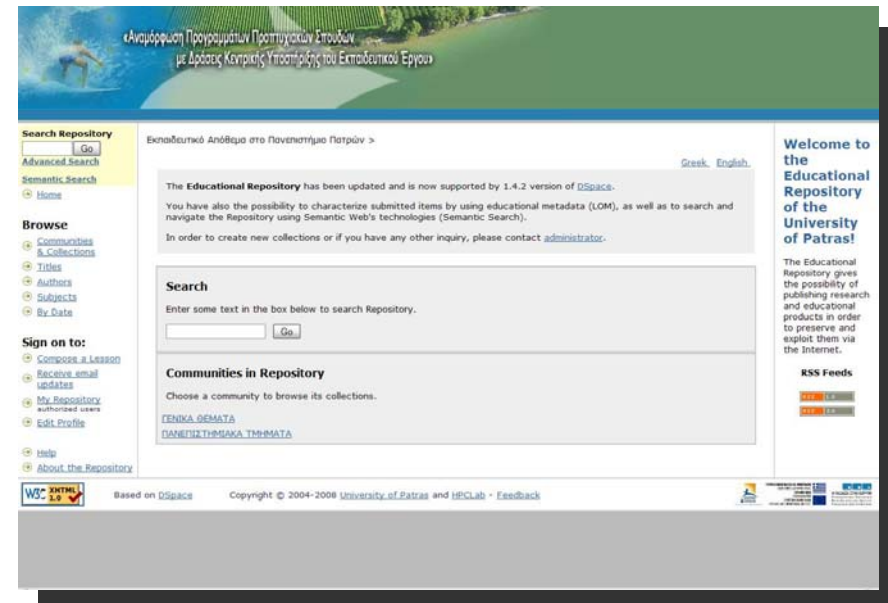

Dimitrios Koutsomitropoulos, Georgia Solomou,
Andreas Alexopoulos and Theodore Papatheodorou

High Performance Information Systems Lab
Computer Engineering & Informatics Dpt.
School of Engineering, University of Patras
<http://www.hpclab.ceid.upatras.gr>

University of Patras Institutional Repository

A mechanism for the efficient **description, preservation, management, exploitation and distribution** of the University's educational and scientific material

- ▶ Built upon the open-source **DSpace** digital repository system
- ▶ Item description using the **Dublin Core** metadata schema

<http://repository.upatras.gr/dspace>

Articles, Books, Theses, Journal Papers, Images, Videos, Learning Objects, Data Sets, ...

University of Patras Institutional Repository

Additional features

- ▶ Multilingual support
 - User Interface (Greek, English, ...)
 - Metadata - Characterization of items in more than one language
- ▶ Advanced search service
 - Full text
 - Metadata
 - **Semantic Search**
- ▶ Advanced browsing
 - **Semantic navigation**

The Semantic Web

- ▶ New potential for the Web
 - Rich descriptions of resources + co-relations
 - Ability to reason about information
 - Knowledge acquisition and discovery (Inference based)
- ▶ Ontology Languages: OWL
 - Extensions to RDF(S)
 - Standard vocabulary for ontology representation
 - Decidable, sound & complete (! *OWL Full*)
- ▶ OWL 2: extension to OWL
 - More expressive constructs
 - Role-chains and characteristics
 - Negative assertions
 - Punning

Metadata & Applications

- ▶ Metadata Standards
 - Capture a level of meaning of (web) resources
 - Predate SW standards
- ▶ The Dublin Core
 - 15 main elements
 - Many other *qualifications*
 - Sub-elements – correspond to relations
 - Popular in describing resources
 - In Digital Libraries / Repositories (like DSpace)
 - Supports interoperability
 - Structural consistency in information exchange

Metadata in DSpace

- Based on Dublin Core
 - Influenced by the Library Application Profile (DC-LAP)
 - A total of 66 elements (some invisible)
 - Including qualifications
- Includes non-standard elements
 - Cannot be mapped to DC
 - e.g. **“author”** and **“sponsorship”**
- Exportable through OAI-PMH
 - Provided a mapping is specified

The Problem

- ▶ Metadata in DSpace: Monolithic approach
 - Metadata flatly organized
 - Meaning lies *implicitly* in the **structure**
 - or in the (human-understandable) specifications!
 - Not machine “*understandable*”
 - Semantically **semi-structured** knowledge models
 - In contrast to fully-structured ontology models

Item 1987/96: Presentation about the 3D reconstruction of the Parthenon of Athens

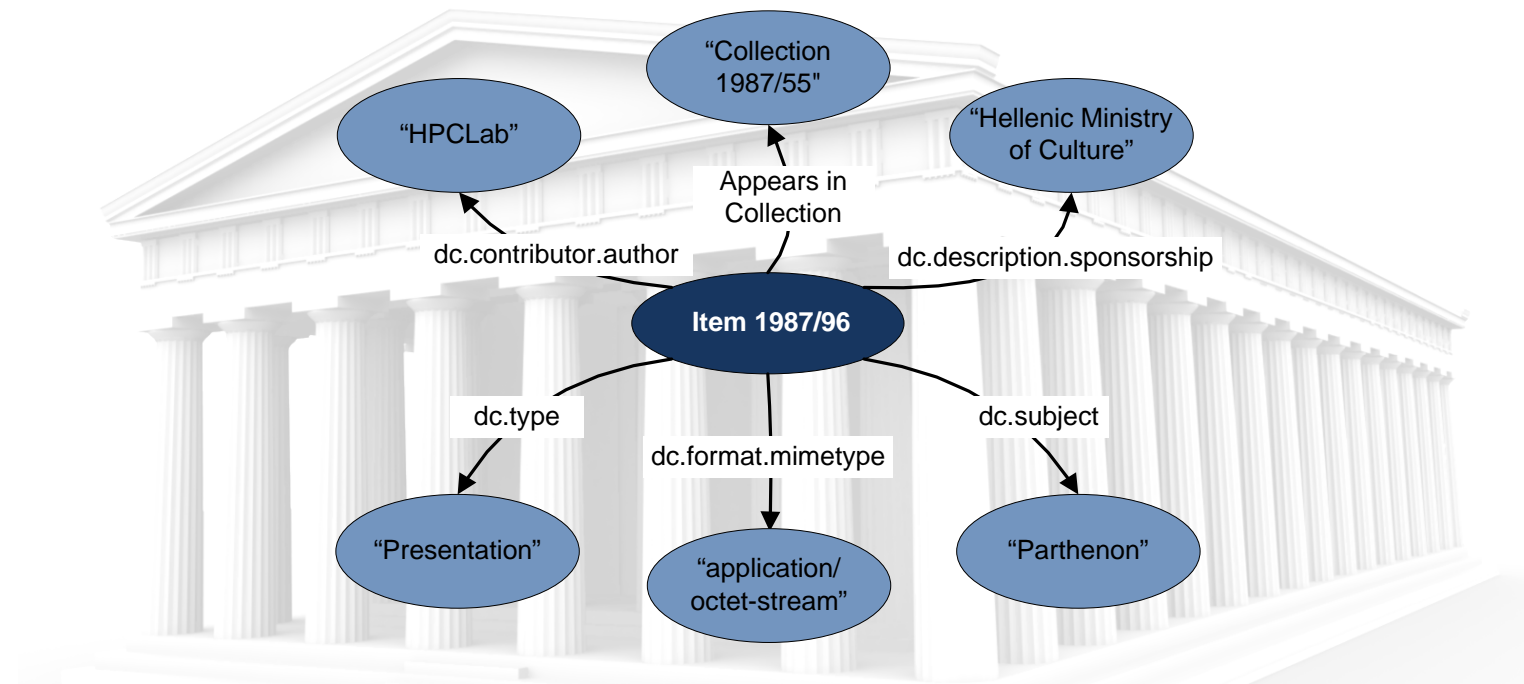

Item 1987/96

DSpace's 'Item View' page for item 1987/96

Approach

- ▶ **A.** Create an *Ontology* for Dublin Core and DSpace
 - up to OWL 2 level (non-standard inferences)
 - Produce *meaning* out of *structure*
 - e.g. implement qualifiers as *sub-properties*
 - Make **explicit** the spec and common-sense constraints
 - e.g. inverse relation between `dc:hasPart` and `dc:isPartOf`
- ▶ **B.** Populate the ontology
 - Transform and map *existing* DC metadata to a new ontological model
- ▶ **C.** Semantics-aware services for DSpace
 - Semantic Search
 - Semantic Navigation

An Ontological Model for DC & DSpace

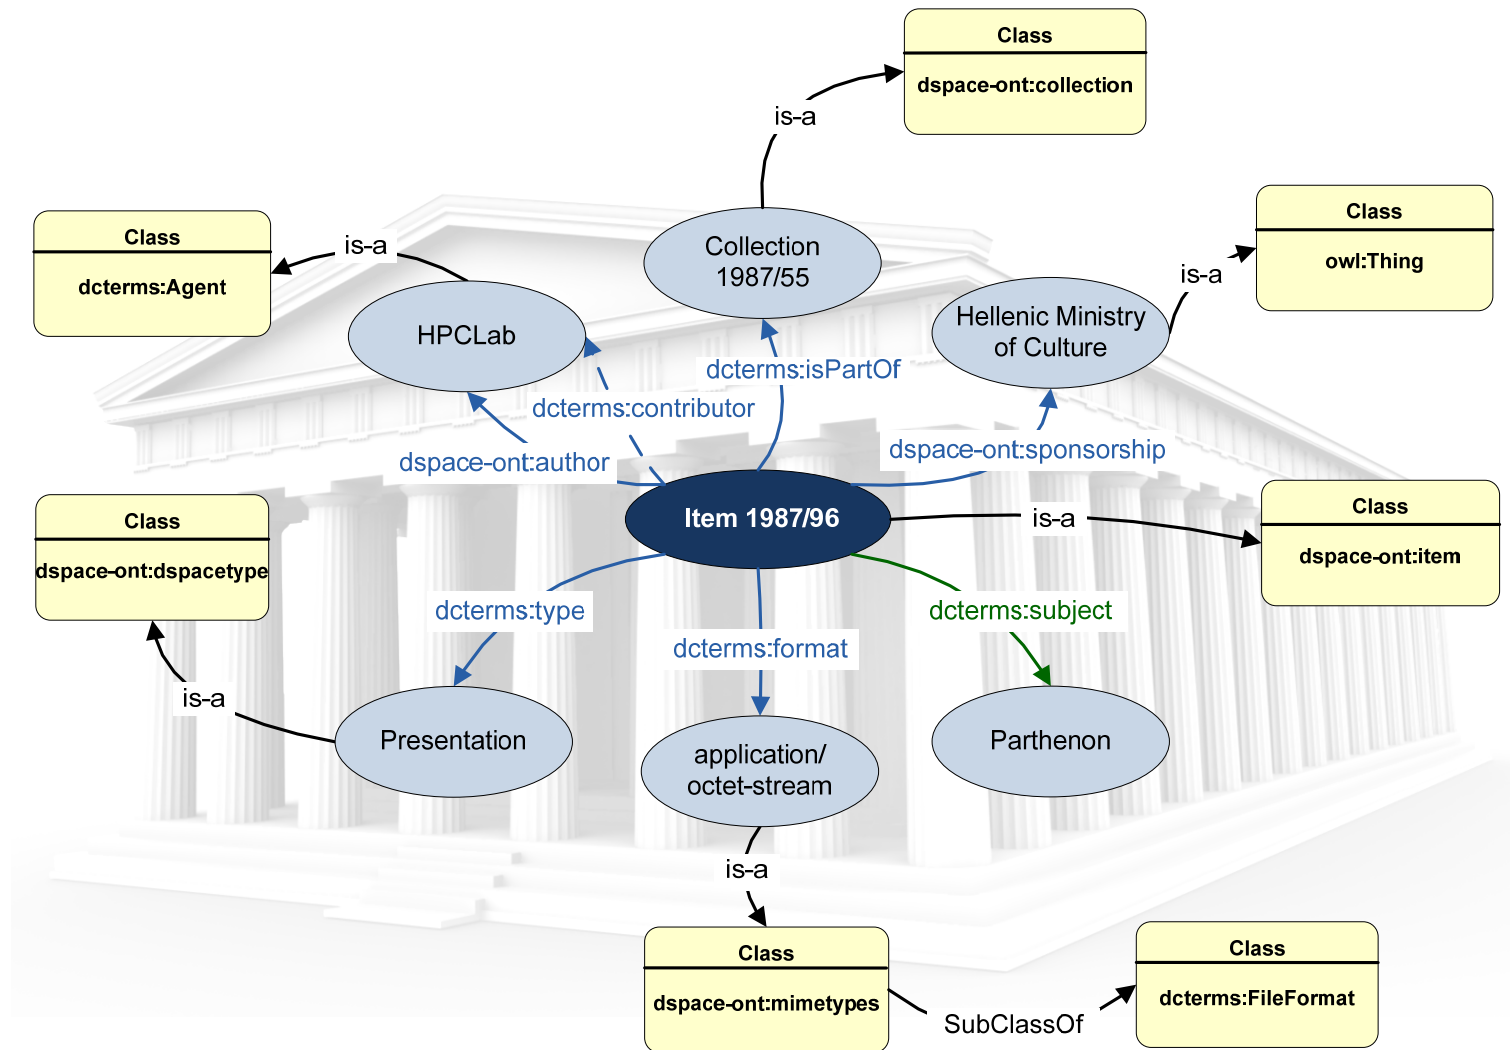

- ▶ Based on existing DC implementation in RDF
- ▶ Create incremental semantic *profiles* of DC
 - ...by applying the *semantic profiling*¹ technique
- ▶ Gradually, tailor to the specific domain
 - University of Patras DSpace Installation
 - Based on DSpace
- ▶ Preserve the original DC model
 - Physically separate profiles
 - One `owl:imports` the other
 - Smoothly refine the original model

¹ Semantic Interoperability of Dublin Core Metadata in Digital Repositories. In Proc. of 5th International Conference on Innovations in Information Technology (Innovations 2008), pp. 233–237, 2008.

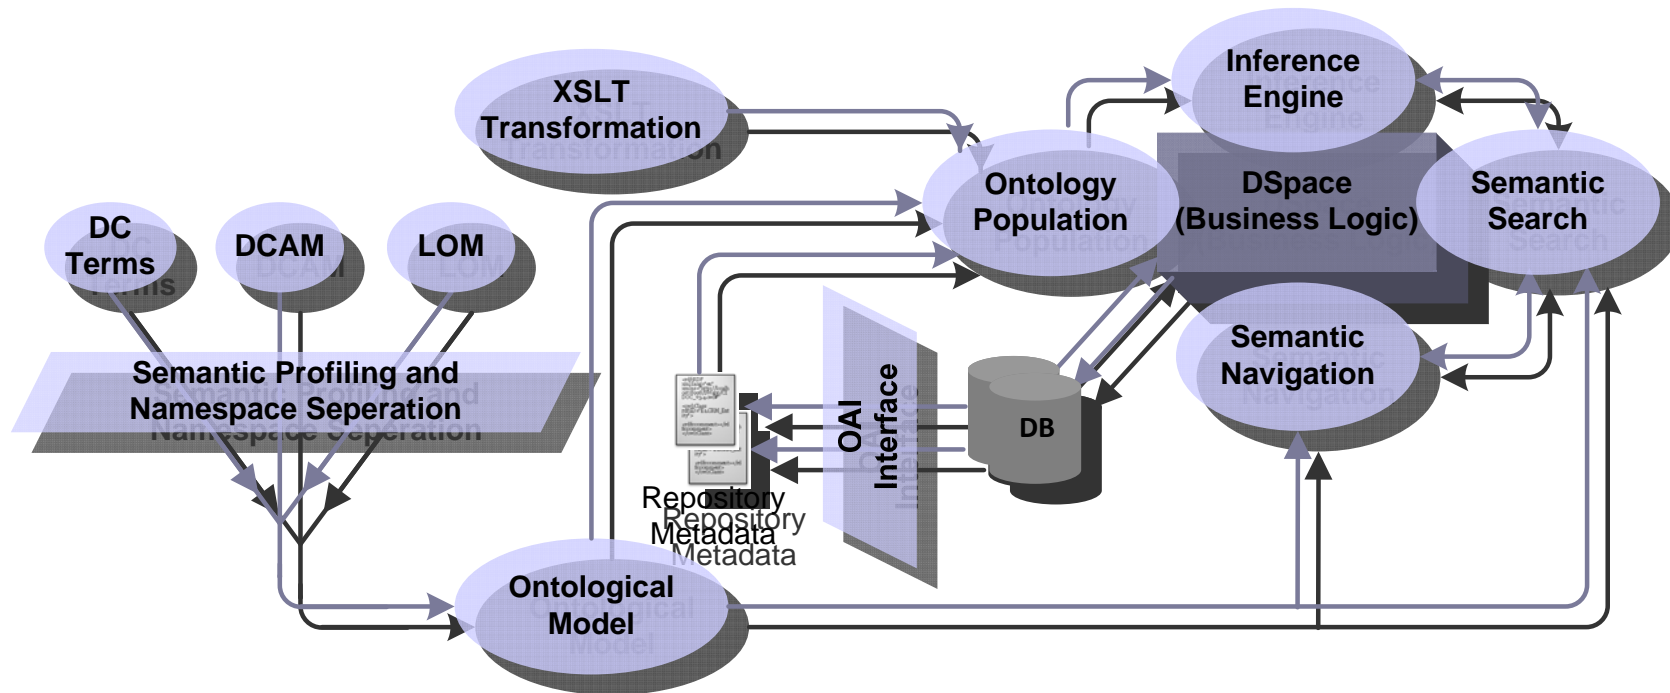

Ontological Data

- ▶ How to populate the ontology?
 - Harvest and map repository's metadata
 - Through the standard OAI-PMH interoperability interface
- ▶ Minimum intervention
 - Not *altering* the database
 - Not *accessing* the database
- ▶ ***Automated*** population
 - Using standard XML-based technologies (XSLT)
...an interoperable approach for ontology construction and population

Semantic Search

- ▶ Queries are typed as simple text using the Manchester OWL syntax
- ▶ Type of accepted queries:
 - Valid ontological class names
 - Class expressions (existential qualifications , cardinality restrictions, ...)
 - Boolean combinations of class expressions

Semantic Search

DL Query:

Results 1-20 of 34.

HPCLab

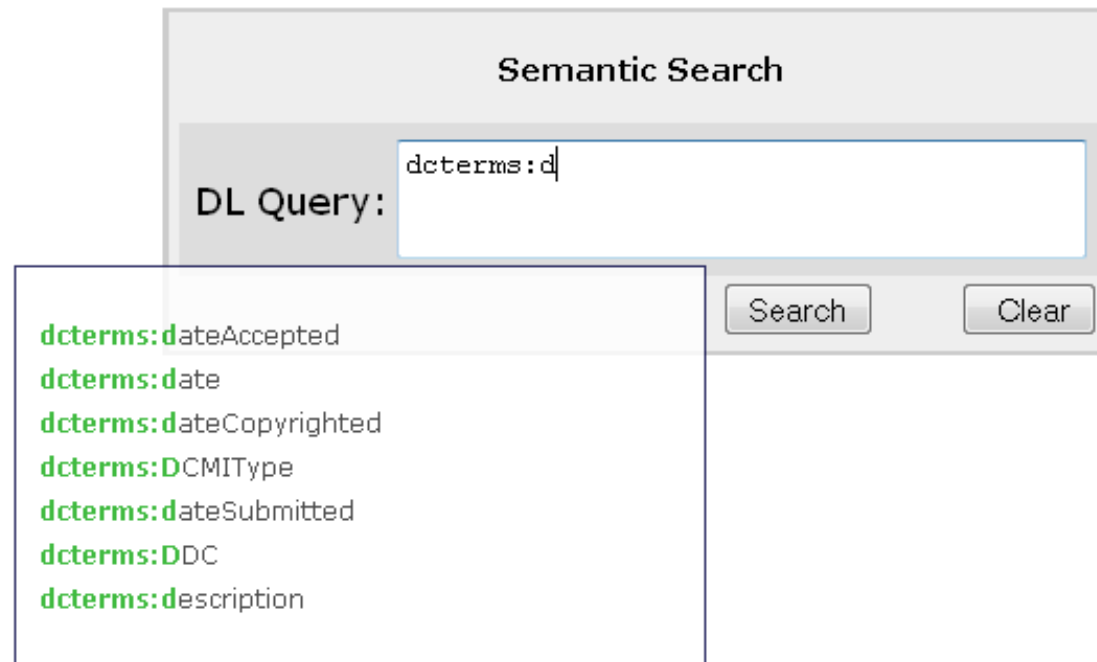

The Manchester OWL Syntax

- ▶ A user-friendly syntax for OWL
 - Maps Description Logics symbols to English words and phrases
- ▶ Designed for writing OWL class expressions or even complete OWL ontologies

OWL Expression	Description Logics Symbol	Manchester Syntax
someValuesFrom	\sqcap	some
allValuesFrom	\sqsupset	only
hasValue	\sqcap	value
minCardinality	\geq	min
cardinality	$=$	exactly
maxCardinality	\leq	max
intersectionOf	\sqcap	and
unionOf	\sqcup	or
complementOf	\neg	not
SubPropertyChain	\circ	o

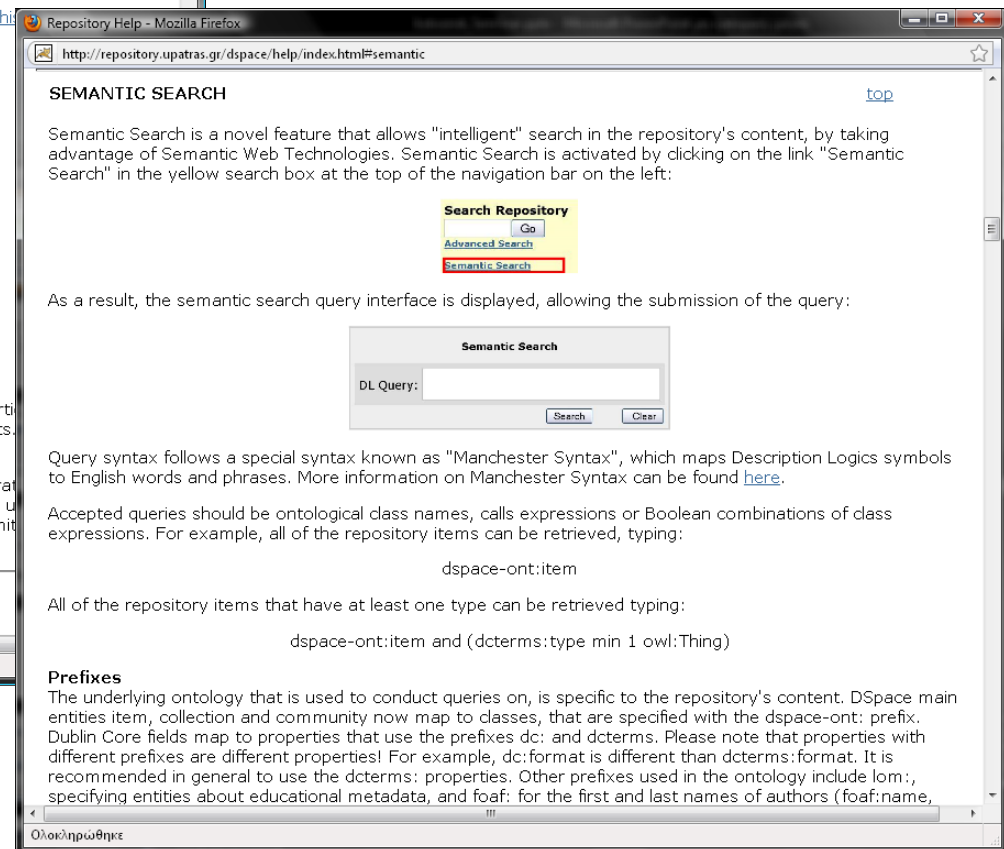

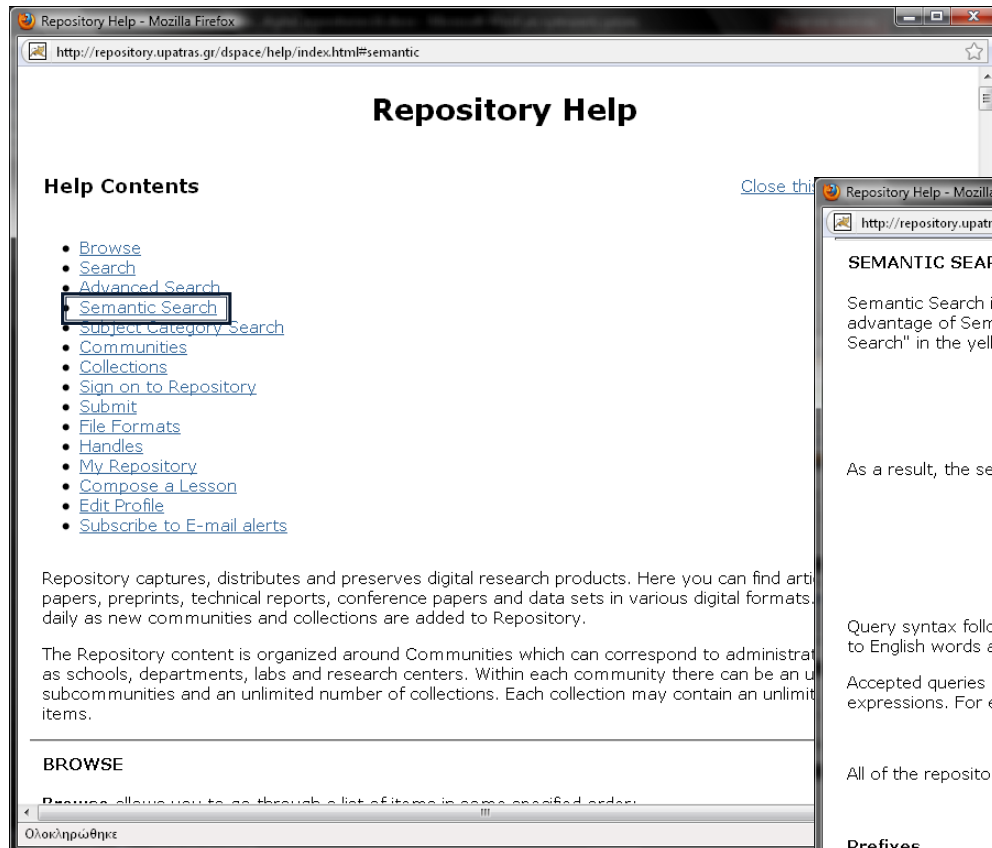

⇒ Offers a simpler way to end users for formulating their queries

Auto-complete Facility

Suggestion of a list of entities that belong to the knowledge base (classes, properties and individuals names)

Help for Semantic Search

Example–*Conjunctive Queries*

Semantic Search

DL Query: `dcterms:type value dspace-ont:Book and
dcterms:audience value lom:Student`

Results 1-1 of 1.

oai:repository.upatras.gr:1987/188

Show all items of type “*Book*” that are mainly intended for Students (audience of type “*Student*”)

Example – *Role Chains*

Show who draws
sponsorship from the
“*Hellenic Ministry of
Culture*”

Semantic Search

DL Query:

Results 1-2 of 2.

HPCLab
oai:repository.upatras.gr:1987/96

Sponsorship refinement:

`inv(dcterms:contributor) o sponsorship SubPropertyOf sponsorship`

Example – *Role Chains* (2)

Find co-authors of
author with surname
“Drake”

Semantic Search

DL Query: `dspace-ont:co_author some (foaf:surname value "Drake")`

Results 1-2 of 2.

[Dawson David](#)

[Drake Karl-Magnus](#)

Co-author declaration:

`inv(author) o author SubPropertyOf co_author`

Example – *Cardinality Restrictions*

Authors of items that
have at least two
different formats

Semantic Search

DL Query: `inv(dspace-ont:author) some (dcterms:format min 2 owl:Thing)`

Results 1-2 of 2.

Possible Improvements

- ▶ A more user-friendly interface
 - Provision of a fixed list of common queries expressed in physical human language
 - Facility that will guide (non-familiar with OWL) users in creating queries in Manchester OWL syntax
- ▶ Integration with controlled vocabularies/thesauri
 - Expressed in SKOS (OWL)
 - Extend semantic search to include controlled vocabulary/thesaurus concepts
 - Augment subject search
- ▶ *Federated* Semantic Search

Conclusions

- ▶ Semantics for DSpace metadata
 - Knowledge discovery (*high, OWL 2 expressivity*)
 - Automatic model population
 - Alleviate the “bootstrapping” problem
- ▶ Novel Semantic Services
 - Augment traditional search and navigation
 - Intelligent retrieval and discovery
 - “Plug-in” philosophy
- ▶ Interoperable design
 - Easy to integrate in any digital repository (OAI-PMH)
 - Straightforward integration with other schemata (e.g. LOM)
 - Semantic interoperability
